| Subject of Review:  | Despite a substantial increase in global per capita food production over the past two decades, the size of the undernourished population has grown over the same time period. Although there are many factors contributing to the persistently large size of the food-insecure population, increasing and highly volatile food prices, climate change, and population growth in particular have all significantly reduced household access to an adequate diet. In this paper we use data from the Bangladesh Integrated Household Survey to explore the intra-household allocation of food, with an emphasis on the measurement of food security at both the individual and household levels. |  |                  |
| Purpose of Review:  |  | ensure the high-quality of the economic a<br>ods, objective interpretation of results, an<br>audience.   |                  |
