

December 2005 Food Security Supplement Data File: Technical Documentation

Prepared by Mark Nord
Economic Research Service (ERS)
August 7, 2006

Overview

This document provides technical information on the Current Population Survey Food Security Supplement (CPS-FSS) conducted by the U.S. Census Bureau for the U.S. Department of Agriculture in December 2005. The CPS-FSS data are available from the U.S. Census Bureau in two formats: ASCII format on CD-ROM, and ASCII format via the DataFerrett system (with optional SAS code to create a SAS datafile from the ASCII data accessed via DataFerrett). The Food Security Briefing Room on the Economic Research Service website provides additional documentation, a copy of the questionnaire, and information on the concepts and history of the food security measurement project.

Technical Description

The CD-ROM data file is in ASCII format and consists of 153,049 logical records. Each record represents one person in a surveyed household or one address that was selected for the core labor force survey but that either was vacant, was not a residence, could not be contacted, or refused to participate. Noninterview households (16,875) are included in the CD-ROM file with their noninterview status indicated. Interviewed households (54,556) include 136,174 person records. Of the interviewed households, 47,518 households completed the Food Security Supplement as well as the labor force survey and included 119,238 person records.

The DataFerrett system files do not include noninterview households (but do include interviewed households with Supplement data missing). Data files downloaded from DataFerrett, therefore, consist of 136,174 records comprising 54,556 households.

A subset of variables on each record contains data about the household of which the person is a part. These variables have the same value for all persons in the same household.

Contents of the Data File

The file includes data in three general categories:

- (1) Monthly labor force survey data and recodes, collected by the Census Bureau for the Bureau of Labor Statistics. Included are geographic, demographic, income, and employment data that may be of interest to those analyzing the Food Security Supplement data. These variables are described briefly in the data dictionary on the CD-ROM or DataFerrett. More detailed information on concepts and definitions underlying these data is available in the technical documentation for the CPS monthly labor force data, available from the Bureau of Labor Statistics.

- (2) Food Security Supplement data, collected by the Census Bureau for the United States

Department of Agriculture. These data consist of answers by household respondents to questions about household food expenditures, use of food assistance programs, and experiences and behaviors related to food security. All of the Food Security Supplement data are household-level data.

(3) Food security status and scale variables calculated from the Food Security Supplement data by the Economic Research Service of the U.S. Department of Agriculture. These household-level variables (HRFS12CX-HRFS30DE) are described in detail later in this document.

(4) Weighting variables calculated by the Census Bureau as the number of persons or households represented by each person or household in the sample. Separate weights are calculated for the Food Security Supplement and the core CPS. Selection of appropriate weights for statistical estimation is described later in this document.

Contents of the Food Security Supplement Questionnaire

A copy of the Food Security supplement questionnaire is available on the ERS website (address at end of this document) and on the public-use data file CD-ROM available from the Census Bureau. Variable names in the data dictionary generally consist of the prefix HE (household variable, edited) followed by the question number from the questionnaire. The major sections are as follows:

- (1) Food Spending (HES1A-HES8)
- (2) Minimum Food Spending Needed (HES8B-HES8D)
- (3) Food Assistance Program Participation (HES9-HESP9)
- (4) Food Sufficiency and Food Security (HESS1-HESSH5). This section includes the 18 food security questions that are used to calculate the 12-month Food Security Scales as well as follow-up questions that are used to calculate the 30-day food security scales.
- (5) Ways of Avoiding or Ameliorating Food Deprivation—Coping Strategies (HESC1-HESCM4)

Changes from Previous Years' Food Security Supplements

In 2002-04 the food security questionnaire included a split-ballot test (in month-in-sample) of 30-day follow-up questions to the first six food security scale questions—SSM2, SSM3, SSM4, SSM5, SSM6, and SHM1. In 2005, these questions were extended to all supplement households so that both 30-day and 12-month data are collected for all 18 food security scale questions. New 30-day household food security scales based on these data have been added to the data files.

Additional variables in the core CPS data identify persons displaced by Hurricane Katrina. The questions were asked of CPS households throughout the country, since some evacuees relocated far from the storm-affected areas. Brief descriptions of the "Katrina" variables are provided in the data dictionaries, and more detailed information is available from the Census Bureau website.

Two recent changes in the core (monthly labor force) CPS data affect variables that may be used in food security analyses. Beginning in 2003, the variable indicating the race of individuals in the core CPS demographic data includes multiple-race categories; the name of the variable is PTDTRACE. Beginning in 2004, metropolitan statistical area residence was reported based on the 2003 OMB delineations. The changes reflect not only population and commuting data from the 2000 census, but also new standards for

metropolitan area classification. Statistics by metropolitan area residence status in 2004 and 2005 are not precisely comparable with those for 2003 and earlier years. Further information on the new metropolitan statistical area standards is available on the Census website.

Screening of the Food Security Supplement

The Food Security Supplement includes several screens to reduce respondent burden and to avoid asking questions that may seem inappropriate to respondents given other information they have provided in the survey. The screener variables use information from the monthly labor force core data as well as from the Food Security Supplement. Households with incomes above 185 percent of the poverty threshold (HRPOOR=2, approximated from HUFAMINC and HRNUMHOU) that responded "no" to HES9 were not asked the questions on participation in food assistance programs. Households with income above 185 percent of poverty that registered no indication of food stress on HES9 or HESS1 were not asked the rest of the questions in the "Food Sufficiency and Food Security" section or those in the "Ways of Avoiding or Ameliorating Food Deprivation" section.

There were also two "internal" screeners in the main food security section (the questions that are used to calculate the Household Food Security Scale). This series of questions is divided into three blocks. After each of the first two blocks, households that registered no indication of food stress in the preceding block are skipped over the rest of the "Food Sufficiency and Food Security" section. The variable HRFS12MS indicates the screening status of each household on the food security scale questions. It indicates whether the household was screened out at the initial screen (before the first of the 18 scale questions), or was screened out after the first or second blocks of questions, or was not screened out and was asked all questions. Households that were screened out at the initial screen are assumed to be highly food secure (raw score imputed as zero). However, if they were screened out at the initial screen without having given a valid response to either screening question, or if they were screened out after the first or second block without having given a valid response to any of the questions in the scale, HRFS12MS is coded "Missing" (-5). The food security scale and status variables for these households are coded as "No Response" (-9), except that the Children's Food Security Scale variables are coded as "Not in Universe" (-1) if there were no children in the household.

The screening rules that determine whether a household was asked the questions in the food security scale varied somewhat during the first four years of fielding the Food Security Supplement (1995-98). These different screening procedures affected the estimated prevalence of food security differently in each year. From 1998-2005, screening procedures have remained unchanged and prevalence rates are directly comparable. The variable HRFS12CX indicates screening status under the "common screen" that allows comparisons of food security prevalence rates across all years since data were first collected in 1995. To compare 2005 prevalence rates to those for 1995, 1996, or 1997, users will need to edit the food security status variable of interest to "high food security" (raw score=0) for households that would have been screened out under the common screen (HRFS12CX=1). Comparison can then be made to variables in the common screen series (HRFS12C1, -C2, -C3, and -C4) in any earlier year's data.

Screeners also were applied based on whether the household included any children, so that households without children were not asked questions that refer specifically to children. For this purpose, persons 17 or younger are classified as children except those who are household reference persons or spouses of household reference persons (PERRP=1, 2, or 3).

Food Security Status and Scale Variables

The main purpose of the Food Security Supplement is to provide information about the food security of the

Nation's households. Six series of variables are provided for this purpose. The first three series indicate the food security of households, children in households, and adults in households during the 12 months prior to the survey. The remaining three series indicated the food security of households, children in households, and adults in households during the 30 days prior to the survey. Each series includes one (or two in some series) categorical food security status variables, a raw score variable, and a scale score variable.

A number of changes have been made in the food security status and scale variables in the December 2005 data. An overview of the changes is provided first, followed by a description of each variable.

- The 12-month "common screen" food security status variables (HRFS12C1, -C2, -C3, and -C4) have been dropped. These variables are only needed for comparisons with data collected in 1995, 1996, and 1997. They can be calculated from the corresponding variables in the HRFS12M1-M4 series using information from the HRFS12CX variable (described earlier).
- HRFS12M2 has been dropped. This variable subdivided the category now labeled as "very low food security." It was originally intended to identify households with very low food security among children and/or very severe food insecurity among adults. USDA found that the variable did not perform well and has not used it for monitoring purposes since the original 1995 report. The children's food security scale has replaced it as a measure for identifying very low food security among children. The variable HRFS12MD, which replaces HRFS12M2 in the series differentiates households with high food security (those that reported no food-insecure conditions) from those with marginal food security (those that reported 1 or 2 food-insecure conditions). Both are classified as food secure on HRFS12M1.
- The 12-month children's food security status variable HRFS12M5 has been replaced with HRFS12MC, which identifies the additional category "Low food security among children," which was not identified prior to this year.
- A series of variables indicating the 12-month food security status of adults in the household has been added (HRFS12M8, -M9, and -ME). These measures are calculated by applying to all households the standard methods normally applied to households with no children.
- Improved measures of food security during the 30 days prior to the food security survey have replaced the 30-day measures available in previous years. The addition of the 30-day-referenced follow-up questions SSM2, SSM3, SSM4, SSM5, SSM6, and SHM1 support the calculation of 30-day measures that include equivalent items to all those in the 12-month measures. These measures, therefore, cover the full range of food insecurity measured by the 12-month measures. The previous 30-day household variables HRFS30M1, -M2, and -M3 have been dropped. Three sets of variables have been added to indicate the 30-day food security status of households, based on a combination of adult and child items (HRFS30D1, -D2, -D3, and -D4); children in the household (HRFS30D5, -D6, and -D7), and adults in the household (HRFS30D8, -D9, and -DE). These three series identify the same ranges of severity as the corresponding HRFS12xx variables.
- New labels for ranges of severity of food insecurity are introduced with the 2005 data. The labels "low food security" and "very low food security" have replaced "food insecurity without hunger" and "food insecurity with hunger," respectively. USDA made these changes in response to recommendations by an expert panel convened by the Committee on National Statistics (CNSTAT) of the National Academies. The subcategories "high food security" and "marginal food security" were introduced to differentiate food secure households that reported no indicators of food insecurity from those that reported at least one such indicator. See the Food Security Briefing Room on the Economic Research Service Web site (URL address at the end of this document) for further information on the CNSTAT review and recommendations.

The food security status variables are as follows:

Household Food Security Scale, 12-Month Reference Period

- HRFS12M1 is a categorical variable that classifies households in three categories: food secure, low

food security, and very low food security. Users may combine the latter two categories as food insecure. Although the labels for these ranges are new, the method of classification is unchanged from 2004 and earlier years.

- HRFS12MD is the same as HRFS12M1 except that the food-secure category is subdivided to differentiate households that reported no food-insecure conditions (high food security) from those that reported one or two food-insecure conditions (marginal food security).
- HRFS12M3 is the raw score—a count of the number of questions in the 12-month Household Food Security Scale that were affirmed by the household respondent.
- HRFS12M4 is the scale score, a continuous score based on fitting the data to a single parameter Rasch model using item calibrations calculated from the 1998 data. Computed values range from about 1 to 14. Scale scores for households that affirmed no items cannot be calculated within the Rasch model. These households are food secure, but the degree of their food security is not known and may vary widely from household to household. They are assigned scale scores of 6 to remind users that they require special handling in analyses that assume linearity of the scale scores.

Children's Food Security Scale, 12-Month Reference Period. A set of food security variables indicating the food security of children in the household is calculated from responses to the 8 questions in the scale that ask specifically about food conditions among the children.

- HRFS12MC is a categorical variable that classifies households in three categories based on the food security of children in the household: food secure, low food security, and very low food security. Note that the coding of this variable differs from that of HRFS12M5 in previous years. HRFS12MC differentiates households with low food security among children (raw score 2, 3, and 4) from households in which children were food secure (raw score 0 and 1). The category very low food security among children in the 2005 data (HRFS12MC=3) is exactly equivalent to the category food insecure with hunger among children (HRFS12M5=2) in earlier years.
- HRFS12M6 is the raw score on the 12-month child-referenced items.
- HRFS12M7 is the Rasch model-based scale score on the Children's Food Security Scale.

Adult Food Security Scale, 12-Month Reference Period. A set of food security status variables indicating the level of food security among adults in the household is calculated from responses to the 10 questions in the scale that ask specifically about food conditions among adults in the household, and of the household in general. This variable provides a more nearly comparable measure of food security between households with and without children, or among households with children in different age ranges than does the Household Food Security Scale (the HRFS12M1—M4 series).

- HRFS12M8 is a categorical variable based on the scale score (HRFS12ME) that classifies households in four categories of food security among adults: High, marginal, low, and very low. Users may combine the first two categories as indicating food security among adults and the latter two as indicating food insecurity among adults.
- HRFS12M9 is the raw score on the 12-month adult- and household-referenced items.
- HRFS12ME is the Rasch-model-based scale score on the Adult Food Security Scale.

Household Food Security Scale, 30-Day Reference Period. HRFS30D1, -D2, -D3 and -D4 correspond to HRFS12M1, -MD, -M3, and -M4, except that they are based on food security conditions during the 30-day period prior to the food security survey rather than the 12-month period. *Note: these variables are not comparable with the 30-day food security variables in previous years' data (HRFS30M1, M2, and M3). The earlier years' measures were based on only a subset of the items in the 2005 scale.*

Children's Food Security Scale, 30-Day Reference Period. HRFS30D5, -D6, and -D7 correspond to HRFS12MC, -M6, and -M7, except that they are based on food security conditions among children during the 30-day period prior to the food security survey rather than the 12-month period.

Adult Food Security Scale, 30-Day Reference Period. HRFS30D8, -D9, and -DE correspond to HRFS12M8, -M9, and -ME, except that they are based on food security conditions among adults during the 30-day period prior to the food security survey rather than the 12-month period.

Constructing Household Characteristics from Person Records

To compute some household characteristics such as household size, presence of children, or presence of elderly members, it is necessary to identify the records of all persons in the same household. Households are uniquely and completely identified by three variables in combination: State of residence (GESTCEN), and two household identifiers (HRHHID and HRHHID2). Characteristics of the household reference person can be assigned from the person record with PERRP 1 or 2, which will always be the record lowest-numbered PERRP in the household. To match to other months' CPS files, add the HRMIS variable to the household identification, adjusting one of the files for the difference in survey month.

Weights—Estimating Population Distributions of Person and Household Characteristics

The CPS is a complex probability sample, and interviewed households as well as persons in those households are assigned weights so that the full interviewed sample represents the total national non-institutionalized civilian population. Initial weights are assigned based on probability of selection into the sample, and weights are then adjusted iteratively to match population controls for selected demographic characteristics at State and national levels. There are two sets of household and person weights in this data file: (1) labor force survey weights, (2) Food Security Supplement weights.

The labor force survey weights, HWHHWGT for households and PWSSWGT for persons, are positive for persons in all interviewed households (except that person weights for persons in the armed forces are zero or missing). These weights would be appropriate for analyzing whether households or persons who completed the Supplement differed from those who declined to complete the Supplement.

About 15 percent of eligible households completed the core labor force survey but declined to complete the Food Security Supplement. The Supplement weights, HHSUPWGT for households and PWSUPWGT for persons, are adjusted for Supplement nonresponse so that the Supplement respondents represent the national non-institutionalized population. These weights are appropriate for estimating household distributions of variables in the Food Security Supplement, including food security status.

Household weights are attached to all person records in the household. To estimate household frequency distributions, the sample must be limited to one record for each household. This is usually accomplished by limiting the sample to records of household reference persons (PERRP=1 or 2). Noninterview or nonsupplement households must be excluded from these analyses based on HRINTSTA or HRSUPINT.

All weight variables have four implied decimal places in the CD-ROM (the decimal point is not included). Divide the weight variables by 10,000 for analysis in units or by 10,000,000 for analysis in thousands of persons or thousands of households. The format of weight variables downloaded from DataFerrett are somewhat unpredictable. Sometimes they are in units; sometimes they have four implied decimal places. These should be checked prior to use.
