A basic assumption of health and nutrition education programs is that the foods being promoted will be available. On the Navajo reservation, where the nearest source for groceries may be a trading post or convenience store, this assumption may not be valid. To test this assumption, Diné Tribal College staff and students, in partnership with the University of New Mexico, developed and administered a 69-item food inventory at rural trading posts and convenience stores

across the three States encompassing the Navajo reservation. The food inventory included only “healthful foods” such as fruits, vegetables, low-fat dairy products, and lean meat. Interviewers asked store managers open-ended questions about the stores’ primary customers and foods most commonly sold. The sample included a total of 48 stores, with one large grocery store for comparison. Individual foods were combined into broad food categories.

The authors used analysis of variance to determine differences in food categories by State, type, and distance of store from a major grocery store. Seventy-five percent of store owners reported that local people were their primary customers, and 53 percent reported that “junk food” was the food most commonly sold, while 19 percent reported staples as the foods most commonly sold. All but five stores had at least one fresh fruit or vegetable available; the mean number of these items available was nine. Only 4 stores had 1-percent milk, and only 6 stores had skim milk available. Ninety percent of the stores accepted WIC stamps, and these stores had whole grain cereals, fruit juices, and low-fat string cheese available. There were no differences in food availability by type of store or distance from a major grocery store. However, the number of fresh fruits and vegetables and total variety differed significantly across States. Their results show that the number of healthful foods available throughout the reservation is limited, and that store owners would stock more of such foods if they were demanded.

The Impact of Welfare Reform on Food Assistance Programs on American Indian Reservations: The Northern Cheyenne Case Study

The goal of this research project was to identify and evaluate the impacts of recent welfare reforms, particularly reforms related to food assistance programs, in the Northern Cheyenne Nation. The report documents the recent experiences of food assistance programs and participants, and clarifies how recent welfare reforms affect food assistance and other service needs of Northern Cheyenne residents. Davis et al. present historical, demographic, and cultural information about the Northern Cheyenne nation that is useful for understanding current conditions as well as the significance of food assistance programs. They report on the nature of the current programs, the views of the program directors, and client experiences with the food programs. The report concludes with an analysis of the authors' findings and a discussion of policy implications.

The analyses reveal impacts of food assistance program changes on Northern Cheyenne cultural and social life as well as on the range of formal and informal services and resources—the local safety net—to which the economically vulnerable Cheyenne have access. Cultural impacts can be seen in the struggle of tribal members to uphold one of their central values—sharing resources with both family and nonfamily to ensure survival—which, like many other American Indian groups, the Northern Cheyenne place as a high

priority. Prevalence of the value placed on sharing and caring for others is evident in the low to nonexistent level of homelessness on this reservation. It is also evident in the everyday actions of individuals who share food with those in need, regardless of how much or how little they have. However, as the numbers needing food assistance increase, the ability of families and the community to care for them is strained.

The authors show that, despite the significance of food assistance programs for increasing well-being, there are important obstacles for individuals attempting to access food assistance. Poor families living in remote reservation areas must make and get to appointments with program personnel in order to receive their benefits. Lack of transportation or of gas money for others to drive them, and a lack of telephones are the most frequently cited problems. The considerable paperwork required of food stamp and other program recipients, and the complexity of the system are often difficult to navigate for many individuals who are trying to establish and maintain eligibility for benefits. This is particularly the case for those who lack high school diplomas or whose first language is Cheyenne. Other common complaints include the lack of jobs and workplaces on or near the reservation where clients may complete required work hours, and inadequate childcare. The frequency of such problems indicates the declining ability of local programs to serve their clients' needs adequately, despite the programs' best efforts. A service gap leads to clients' discouragement and loss of confidence when they fall through the safety net.

Interviews with program directors and clients show that both groups understand the problems and gaps in services. However, constrained by regulations and limited resources, programs are often unable to make the changes needed to solve these problems. Such constraints leave many clients feeling frustrated and perceiving that programs are insensitive to their needs.

Because the Cheyenne are relatively representative of tribal populations in the Plains and elsewhere, this study presents useful insights about the impact of welfare reform on food assistance programs and other elements of the social safety net operating in many reservation communities. The study's findings indicate the importance of examining the intricacies of clients' experiences with food assistance programs, the complexity of food programs, and the relationship of food programs to the whole range of formal and informal resources on which the Northern Cheyenne rely.

Federal Food Programs, Traditional Foods and the Gros Ventre and Assiniboine Nations of the Fort Belknap Indian Reservation

Eating habits and food preparation among the Gros Ventre and Assiniboine peoples have changed dramatically since the establishment of the Fort Belknap Indian Reservation and the introduction of Federal food distribution programs on the reservation. This project documented such changes from the perspective of tribal elders, community members, and associated service providers. Data were collected from both men and women over the age of 50 through a survey designed by Fort Belknap College's principal investigator, a consultant, and three student researchers who were graduates of the college. The survey was administered in and around Fort Belknap Indian Reservation communities during the summer of 1999.

The story that emerges from the study is one of change and loss. Primary food sources have changed dramatically. The results reflect change from traditional

modes of obtaining food (hunting, fishing, and gathering) to reliance on store-bought food. Small gardens, which were prominently featured as a food source historically, have greatly diminished in present times. The use of some dairy products (milk and butter) has varied little over time, but cheese and cottage cheese make up a larger portion of the dairy products consumed today. Survey results also indicated a majority of elders do not receive any type of assistance from the food programs available on Fort Belknap Reservation. Surplus commodities are distributed on the reservation, but not widely.

Traditional food preparation has been replaced by consumption of fast foods, and the traditional Indian diet of buffalo, deer, antelope and elk meats, wild turnip, onion, and carrot, and choke cherries, June berries, service berries, Morgan grapes and Indian peanuts has all but disappeared. Use of traditional foods is now limited to reservation-wide cultural events. The knowledge and skills of tribal elders concerning traditional hunting sites, traditional food preparation, and the use of traditional herbs and plants for healing purposes has not passed to the next generation and is at risk of being lost and disappearing altogether from reservation life and culture.

The study findings suggest that opportunities may exist for less conventional food assistance and nutrition education programs to support the development of traditional food resources on the reservation. Such programs might promote improved nutrition and increased self-sufficiency for the reservation community while at the same time encouraging the preservation of the tribes' productive natural resources, heritage, and culture.

Assessment of Food Concerns, Nutrition Knowledge, and Food Security of Oglala Lakota College Students on the Pine Ridge Reservation

Students from five educational sites on the Pine Ridge Indian Reservation (in South Dakota) were surveyed: Pine Ridge College Center, Pine Ridge; Wounded Knee College Center, Manderson; Pahin Sinte College Center, Porcupine; LaCreek College Center, Martin; and East Wakpamni College Center, Batesland. The interviews, conducted in 1999, included general demographic background questions, multipart interest/needs questions, questions related to current food understanding, and questions related to food adequacy.

Overall, the survey results show Oglala Lakota College (OLC) students are five times more likely to be food insecure with hunger than the national average of 3.5 percent for all households reported by the Economic Research Service for 1998. The authors suggest further research to determine if this level of food insecurity affects academic performance. Students from the Wounded Knee College Center were eight times more likely to be food insecure than the national average.

At the Pine Ridge College Center, 30 percent of the students stated that they consumed the same thing for several days in a row because they had only a few different kinds of food on hand and no money to buy more. This result was surprising because the Pine Ridge College Center houses the largest supermarket on the reservation, and is located within 2 miles of two other grocery stores.

“Feeding self and family” was the primary concern of OLC students, with employment and housing being tied for second place for needs/interests. Employment was the greatest financial need, with “feeding self and family” second. Parents were the number one source of information for feeding students and family; second was a dietitian or nutritionist. Less than 10 percent of OLC students utilized USDA extension programs for information. Parents were ranked the highest (70 percent) in terms of trustworthiness of the information provided.

Thirty-three percent of OLC students surveyed could not pick out which package of chicken was the best buy. Over 12 percent of OLC students surveyed did not understand why hot foods should be kept hot and cold foods cold. Over 86 percent did not know how many servings of bread, cereal, rice, and pasta are recommended for adults, teens, and children daily. Sixteen percent stated incorrectly that physical activity did not count unless you worked up a sweat. Also, 12.4 percent did not know that some form of physical activity is needed at least four times per week for overall good health.

The authors suggest that the new extension education program in holistic human health at OLC, with assistance from other land-grant universities, could coordinate educational activities to improve OLC students’ knowledge of nutrition and health issues identified in the survey.

Dietary Choices and Weight Control Practices Among Cheyenne River Lakota Households

This study describes the prevailing dietary choices and weight control practices among Cheyenne River Lakota households. The authors surveyed a random sample of Cheyenne River Lakota households during the summer of 1999 using a standardized questionnaire and in-person interviews. Follow-up interviews on a random subsample of households helped to verify the questionnaire and sought further information on weight control program preferences.

A total of 216 households participated in the survey. The most frequently consumed high-fat foods included butter/margarine (35 percent > 5 times per week), potato and corn chips (29 percent > 5 times per week), cheese (27 percent > 5 times per week), and hot dogs, bologna, and luncheon meats (26 percent > 5 times per week). Few reported consuming fruits (11 percent > 5 times per week), or vegetables (18 percent > 5 times per week) on a daily basis. Sweetened beverages were consumed frequently, including regular pop (43 percent > 5 times per week) and Kool-Aid® or punch (39 percent > 5 times per week).

Most respondents engaged in mild exercise for at least 30 minutes 3 times per week or more (78 percent). Weight loss or maintenance techniques used frequently included increasing activity levels (59 percent), eating more fruits and vegetables (76 percent), eating less fatty foods (65 percent), eating less sweets (74 percent), and reducing the amount of total food consumed (70 percent). Most individuals (64 percent) were favorable to joining a program that promotes healthy diet and exercise. Major barriers to exercise included lack of time (54 percent) and medical reasons or disabilities (42 percent). Barriers to eating healthful foods included higher costs (50 percent) and unpopularity with the family (40 percent). The authors conclude that nutrition and weight control programs that address these reported barriers and provide incentives for increased participation are needed.
