## Can You Use an Electronic Database?

An electronic database containing data associated with this report is available. It includes county level summary data for contracts and acres enrolled by fiscal year (1986-93) and signup periods 1-12. Variables include total acres, acres by fiscal year, acres by land capability class, average rental rates, erosion reductions, conservation treatments applied, cost share data, base acreage reductions, and other characteristics of CRP land. The database costs \$25 [ASCII, one 3.5" disk]. (New 11/95)

Write to the above address and ask for Conservation Reserve Program Summary File (order # 96004). **Or use our toll-free number, 1-800-999-6779.**

For further information on this database, write Tim Osborn, ERS, Room 537D, 1301 New York Avenue, NW, Washington, DC 20005-4788 or phone 202-219-1030.

## **Abstract**

The U.S. Department of Agriculture (USDA) accepted about 33.9 million acres of cropland into the Conservation Reserve Program (CRP) during 1986-89. This acreage was enrolled in nine separate signups under authority of the Food Security Act of 1985. CRP enrollment was extended through 1995 with passage of the Food, Agriculture, Conservation, and Trade Act of 1990. Three signup periods (the 10th, 11th, and 12th) were held in 1991 and 1992. About 2.5 million additional acres were enrolled in these signup periods under significantly revised program rules. No funds were appropriated for additional signups in fiscal years 1993-95. This report presents tables covering all CRP cropland enrolled in signup periods 1-12 and CRP cropland newly retired for each of fiscal years 1986-93.

**Keywords:** Conservation Reserve Program, highly erodible land, long-term land retirement, supply control, production adjustment, erosion control .

## Summary

More than 36 million acres were enrolled in the Conservation Reserve Program (CRP) in signup periods 1-12, held during 1986-92. This acreage includes over 23 million commodity program base acres and nearly 2.5 million tree acres. Annual CRP rental payments average about \$50 per acre, and annual soil erosion reductions average 19 tons per acre. Most CRP contracts are for 10 years. Texas, with 4.2 million CRP acres, has the most enrollment of any State. Other States with large enrollments include North Dakota (3.2 million), Kansas (2.9 million), Montana (2.9 million), Iowa (2.2 million), and South Dakota (2.1 million).

This report is the fifth in an ERS series summarizing CRP participation. The previous reports were Statistical Bulletins 763 (published in 1988), 785 (1989), 811 (1990), and 843 (1992). This new report covers all acreage enrolled in signup periods 1-12. Signup periods 1-9 were carried out under authority of the Food Security Act of 1985 as amended (1985 Act). USDA accepted 33.9 million acres into the CRP from these signups, held during 1986-89. Signup periods 10-12 were conducted under the Food, Agriculture, Conservation, and Trade Act of 1990 amendments to the 1985 Act, which extended CRP enrollment through 1995. USDA accepted an additional 2.5 million acres from these signups, held during 1991-92. No funds were appropriated for new CRP enrollment in fiscal years 1993-95.

In addition to tables summarizing total CRP enrollment by region and State, this report includes tables showing new enrollment for each fiscal year from 1986 through 1993. The fiscal year tables are particularly useful for tracking CRP land and its associated characteristics as contracts approach their expiration dates. For example, contracts on land first idled in fiscal year 1986 have an expiration date of September 30, 1995, unless producers elected to extend those contracts for 1 additional year. The 1-year extension option applied only to contracts scheduled to expire in 1995.

Congress created the CRP as a voluntary long-term cropland retirement program for highly erodible and/or environmentally sensitive land. Participants (farm owners or operators) receive an annual per acre rental payment plus half the cost of establishing land cover (usually grass or trees) for the 10-15-year contract period. The enrollment mandate in the 1985 Act was 40-45 million acres by the end of the 1990 crop year.

The primary goal of the CRP in 1986-89 was to reduce soil erosion on highly erodible cropland. Secondary objectives included protecting the Nation's long-term ability to produce food and fiber, reducing sedimentation, improving water quality, fostering wildlife habitat, curbing production of surplus commodities, and providing income support for farmers.

The 1990 amendments did not change the basic form of the CRP, but combined the CRP with a new Wetlands Reserve Program (WRP) to form the Environmental Conservation Acreage Reserve Program (ECARP). The 1990 amendments mandated that 40-45 million acres be enrolled in the ECARP by the end of the 1995 calendar year, including the 33.9 million acres enrolled in the CRP during 1986-89. Later legislation capped CRP enrollment at 38 million acres.

A new CRP bid acceptance process, developed by USDA after passage of the 1990 amendments, targeted seven conservation and environmental goals: surface water quality improvement, ground water quality improvement, preservation of soil productivity, assistance to farmers most affected by conservation compliance, encouragement of tree planting, enrollment in areas identified under USDA's water quality initiative, and enrollment in conservation priority areas.

# **The Conservation Reserve Program**

## **Enrollment Statistics for Signup Periods 1-12 and Fiscal Years 1986-93**

**C. Tim Osborn

Michael Linsenbigler**

### **Introduction**

This report is the fifth in a series summarizing participation in the Conservation Reserve Program (CRP). Statistical Bulletin No. 763, published in January 1988, summarized CRP land retirement in fiscal years 1986 and 1987 and presented information on CRP rules, regulations, and implementation. In that bulletin, the 1987 statistics were preliminary and should no longer be used. In September 1989, Statistical Bulletin No. 785 was published. It contained final statistics for fiscal years 1987 and 1988 retirements and enrollment statistics for signup periods 1-7. In July 1990, a third report (Statistical Bulletin No. 811) presented enrollment statistics for the first nine signup periods held during 1986-89 and information for CRP land newly retired in fiscal year 1989. In November 1992, Statistical Bulletin No. 843 provided enrollment statistics for signup periods 1-11 and CRP land newly retired in fiscal years 1990, 1991, and 1992. In this bulletin, we present tables summarizing enrollment for signup periods 1-12 and enrollment for each fiscal year from 1986 to 1993. The fiscal year tables are particularly useful for tracking CRP land and its associated characteristics, as current contracts are scheduled to expire. For example, contracts on land first idled in fiscal year 1986 were scheduled to expire on September 30, 1995, unless producers elected to extend these contracts 1 additional year. As of 1995, this 1-year extension option applied only to contracts scheduled to expire in 1995. Except for a small number of useful-life easements, contracts on CRP land first idled in fiscal year 1993 are scheduled to expire on September 30, 2002.

### **Program Description: Signup Periods 1-9**

Congress established the CRP in Title XII of the Food Security Act of 1985 (P.L. 99-198) as a voluntary long-term cropland retirement program to be administered by the U.S. Department of Agriculture (USDA). USDA provided CRP participants (farm owners or operators) with an annual per acre rent and half the cost of establishing a permanent land cover (usually grass or trees) in exchange for retiring highly erodible or environmentally sensitive cropland for 10 years. The enrollment mandate established in the 1985 Act was 40-45 million acres by the end of the 1990 crop year.

The primary goal of the CRP during 1986-89 was to reduce soil erosion on highly erodible cropland. Secondary objectives included protecting the Nation's longrun capability to produce food and fiber, reducing sedimentation, improving water quality, fostering wildlife habitat, curbing the production of surplus commodities, and providing income support for farmers.

To enroll cropland in the CRP, farmers applied at their local Consolidated Farm Service Agency office (formerly Agricultural Stabilization and Conservation Service) during a designated signup period. Farmers indicated the fields that they proposed to enroll, the annual rental payment that they would require (rental bid), and the Commodity Credit Corporation (CCC) crop base (the amount of the farm's land that can be enrolled in CCC programs) that would be reduced during the 10-year life of the CRP contract. Crop base is reduced by the proportion of the farm's CRP enrollment to its total cropland acreage. Nine signup periods were held from 1986

**Years in which enrolled CRP land could first be retired**

through 1989. In all but the first signup, USDA allowed farmers to retire their land in the current year or to postpone retirement and payments until the following year (see box).

Once all bids were received for a particular signup period, the Secretary of Agriculture determined maximum acceptable rental rates (MARR's) for multicounty areas, referred to as bid pools. Counties were assigned to pools based on similarity of soil erosion rates, crop production levels, and other agricultural criteria. County committees reviewed each application after verifying that eligibility conditions were met. In general, all bids not exceeding the applicable pool MARR were accepted.

Approximately 101 million acres of cropland met the basic highly erodible definition for CRP eligibility during 1986-89. However, CRP participation was limited to no more than 25 percent of the cropland in a county, unless a waiver was requested by county officials and the Secretary of Agriculture determined that exceeding this limit would not seriously depress the county's economy. This limitation effectively reduced highly erodible cropland available for CRP enrollment to 70 million acres. Several CRP changes affecting cropland eligibility were instituted in 1987. <sup>1</sup> Eligibility was expanded, beginning with the sixth signup period, to include filter strips along waterways, and beginning with the eighth signup period, to include cropped wetlands and areas subject to scour erosion. These additions were made to improve water quality. In addition, eligibility criteria were relaxed, beginning with the sixth signup period, to encourage tree planting. Before the sixth signup, at least two-thirds of the field must have been classified as highly erodible to be eligible for CRP. Beginning with the sixth signup, only one-third of the field had to be highly erodible if it was to be planted to trees. Erosion requirements for acreage planted to trees were also reduced from 3T to 2T, or twice the normal soil loss tolerance level. <sup>2</sup> Relevant eligibility criteria for each of the nine signups held in 1986-89 are listed below.

***Signup Period 1 Eligibility (March 3-14, 1986)***

(1) Land in Land Capability Class (LCC, see box) II-V with an annual erosion rate greater than 3T, or (2) land in LCC VI-VIII.

***Signup Period 2 Eligibility (May 5-16, 1986)***

Same as signup period 1

<sup>1</sup> Interim and final rules and regulations are presented in ERS Statistical Bulletin No. 763 (Jan. 1988).

<sup>2</sup> The soil loss tolerance level (T) has been defined as the maximum annual rate of per acre erosion that would still permit indefinitely a high level of crop productivity.

## Land Capability Class and Subclass

USDA's land capability classification system is the most widely used system for judging the suitability of land for agricultural uses. The system is divided into classes I (the lowest) through VIII (the highest) and subclasses e, w, s, and c. The higher the class, the greater the limitations of the soils and the fewer the choices for appropriate agricultural use.

**Classes I, II, and III.** Soils are suitable for cultivated crops.

**Class IV.** Soils can be used for crops, but only if appropriate rotations and practices are used.

**Classes V, VI, and VII.** Soils are not suited to cultivation but are suited to pasture, range forage, trees, certain special crops or wildlife habitat.

**Class VIII.** Soils are limited to recreation, wildlife habitat, or water supply uses.

All classes, except I, are divided into subclasses based on the dominant agricultural limitation. Class I has no subclasses because its soils have no significant limitations. The four subclasses are:

**Subclass e.** Soils are susceptible to erosion.

**Subclass w.** Soils have excess water caused by poor drainage, a high water table, flooding, or seepage.

**Subclass s.** Soils have limited root zones, including shallowness, stoniness, low water holding capacity, low fertility, or presence of salt or other minerals toxic to plants.

**Subclass c.** Soils are limited by climatic conditions.

### ***Signup Period 3 Eligibility (August 4-15, 1986)***

(1) Same as signup period 2, or (2) land in LCC II-V with an annual erosion rate of 2T or greater and serious gully erosion.

### ***Signup Period 4 Eligibility (February 9-27, 1987)***

For 1987 contracts: (1) Same as signup period 3, or (2) land with (a) an erodibility index (EI)<sup>3</sup> equal to or greater than 8, and (b) an erosion rate, with cover, management, and practice factors reflecting crop years 1981-85, greater than that recommended by the Natural Resource Conservation Service (NRCS, formerly the Soil Conservation Service) Field Office Technical Guide (generally greater than T).

For 1988 contracts: Land with (a) an EI equal to or greater than 8, and (b) an erosion rate, with cover, management, and practice factors reflecting crop years 1981-85, greater than that recommended by the NRCS Field Office Technical Guide (generally greater than T).

### ***Signup Period 5 Eligibility (July 20-31, 1987)***

Same as signup period 4, 1987 contracts.

### ***Signup Period 6 Eligibility (February 1-19, 1988)***

(1) Same as signup period 5, (2) land in LCC II-V with an annual erosion rate greater than 2T if planted to trees (only one-third of the field required to meet the erodibility criteria as opposed to the former two-thirds requirement), or (3) filter strips 66 to 99 feet wide adjacent to waterbodies regardless of erodibility.

### ***Signup Period 7 Eligibility (July 18-August 31, 1988)***

Same as signup period 6.

---

<sup>3</sup> The EI is a measure of a soil's inherent potential to erode relative to T, and is based on soil type, slope of the land, rainfall, and wind exposure.

***Signup Period 8 Eligibility (February 6-24, 1989)***

- (1) Same as signup period 7, (2) land with evidence of scour erosion caused by out-of-bank water flows, or
- (3) cropped wetlands.

***Signup Period 9 Eligibility (July 17-August 4, 1989)***

Same as Signup Period 8.

Slightly more than 33.9 million acres were enrolled in the CRP during signup periods 1-9. Of this acreage, 62 percent was located in the Northern Plains, Southern Plains, and Mountain States.

## **Program Description: Signup Periods 10-12**

The 10th signup period (March 4-15, 1991) was the first to be held under the extended CRP enrollment authority provided by the Food, Agriculture, Conservation, and Trade Act of 1990 and under revised USDA program rules. USDA chose not to conduct any signups during the 19 months following the 9th signup period (July-August 1989) in anticipation of CRP program changes that could result from the 1990 legislation.

The 1990 Act did not change the basic form of the CRP. However, the CRP was combined with a new Wetlands Reserve Program (WRP) to form a larger program to be called the Environmental Conservation Acreage Reserve Program (ECARP). The 1990 Act mandated that 40-45 million acres be enrolled in the ECARP by the end of the 1995 calendar year including the 33.9 million acres enrolled in the CRP during 1986-90. Later legislation capped CRP enrollment at 38 million acres.

Besides extending the deadline for CRP enrollment, the 1990 Act also designated eligible lands, provided incentives for hardwood tree planting and conversion of existing CRP acreage to trees, and established conservation priority areas. In addition, it called for 1 million acres per year to be reserved for CRP enrollment in calendar years 1994 and 1995. This acreage was intended to provide a buffer that could be used to enroll highly erodible lands that could not be treated with a conservation plan under the conservation compliance provision of the 1985 Act. However, Congress ultimately did not appropriate funds for additional CRP enrollment in these years.

Taking direction from provisions of the 1990 Act, USDA developed revised program rules for operation of the CRP during 1991 through 1995, including new CRP eligibility criteria and a new bid acceptance process.

All CRP eligibility criteria proposed by the 1990 Act were adopted in the 10th signup except that for marginal pastureland. Conservation on marginal pastureland could be achieved more efficiently under other USDA cost-sharing programs. Land eligibility for the 10th-12th signup periods is listed below.

***Signup Period 10 Eligibility (March 4-15, 1991 )***

- (1) Land in LCC II-V with an annual erosion rate of 3T or greater, (2) land in LCC II-V with an erosion rate of 2T or greater if trees are planted or a serious gully erosion problem exists, (3) land in LCC VI-VIII, (4) land with (a) an EI equal to or greater than 8, and (b) an erosion rate, with cover, management, and practice factors reflecting crop years 1981-85, greater than that recommended by the NRCS Field Office Technical Guide (generally greater than T), (5) land devoted to useful life easements of 15 or 30 years for filter strips, waterways, contour grass strips, permanent wildlife habitat, field windbreaks, shelterbelts, living snow fences, salt tolerant vegetation, or terraces, (6) land in identified State water quality areas (Hydrologic Unit Areas under the USDA Water Quality Initiative), (7) land in conservation priority areas established by the 1990 Farm Act (Chesapeake Bay, Long Island Sound, and the Great Lakes Region), (8) land within a public wellhead protection area established by the Environmental Protection Agency (EPA), or (9) land with evidence of scour erosion caused by out-of-bank water flows.

***Signup Period 11 Eligibility (July 8-19, 1991)***

Same as signup period 10.

### ***Signup Period 12 Eligibility (June 15-26, 1992)***

Same as signup period 10, except that useful-life easements were not required for filter strips, waterways, contour grass strips, permanent wildlife habitat, field windbreaks, shelterbelts, living snow fences, salt tolerant vegetation, or terraces. Congress eliminated the useful-life easement requirement of the 1990 Act since it discouraged enrollment of this acreage in signup periods 10 and 11. Because of the change in the law, farmers who submitted easement bids in the 12th signup period were not required to file an easement. They were required, however, to maintain their CRP acreage in the selected practice for its useful life (15 or 30 years). Producers whose useful-life easement bids were accepted in the 10th and 11th signups, but who had not yet filed their easements, were not required to do so.

Farmed wetlands (wetlands that may be farmed under natural conditions), formerly eligible for CRP enrollment, were made ineligible in signup periods 10-12 even if they would have been otherwise eligible under other criteria. This reflected the preference of Congress to place farmed wetlands in the Wetlands Reserve Program. Prior converted cropland (wetlands converted prior to December 23, 1985), however, remained eligible for enrollment in the CRP provided that such land otherwise met eligible land criteria.

Because remaining enrollment opportunities in the CRP were limited, it was expected that more acreage would be offered by farmers in signup periods 10-12 than could be accepted. Consequently, USDA developed a new bid acceptance process to select acreage that provided the greatest conservation and environmental benefits relative to the government cost of enrollment. The process also promoted rental rate competition between farmers while complying with legislative requirements by insuring that CRP rental payments do not exceed prevailing local rents for comparable land.

In the 10th-12th signup periods, farmers could submit up to four different CRP bid types. "Standard" bids comprised the majority of bids. These contained conservation practices, such as CP 1 introduced grasses, for which useful-life easements of 15 or 30 years were not required. Conversely, "Easement" bids contained practices, such as filter strips, that required useful-life easements beginning with the 10th signup period. "Wellhead Standard" bids were similar to "Standard bids" except that the land being offered was within an approved wellhead protection area. Finally, "Wellhead Easement" bids were for land within an approved wellhead protection area and required the farmer to grant a useful-life easement.

At the conclusion of the 10th and 11th signup periods, all bids were reviewed by county committees to determine if the land was eligible for CRP enrollment and if the farmer was eligible to participate. If one or both of these conditions was not met, the bid was flagged for later rejection.

All bids were then transmitted to the national office of the Consolidated Farm Service Agency. There, each rental payment requested by farmers was screened against a soil-specific estimate of the rent that could be earned on local comparable cropland. Bids that exceeded this amount, adjusted for costs farmers incur due to CRP participation, were rejected. The bid screen amounts used in the 10th-12th signup periods were not related to the MARR's that were uniformly applied within bid pools in signup periods 1-9.

Eligible "Easement," "Wellhead Standard," and "Wellhead Easement" bids that survived the bid screen were automatically approved for CRP enrollment. These bids typically involve a limited number of acres and a small government cost, but provide significant conservation and environmental benefits.

Eligible "Standard" bids that survived the bid screen had to compete for the remaining acreage that could be enrolled based on a predetermined limit. At the heart of this competition was a formula that ranked bids based on the ratio of an environmental benefits index (EBI) to the government cost of the contract. The EBI measured the potential contribution to conservation and environmental program goals that the bid would provide if enrolled. The seven coequal conservation and environmental goals targeted in the 10th-12th signup periods included:

- Surface water quality improvement.
- Potential ground water quality improvement.
- Preservation of soil productivity.
- Assistance to farmers most affected by conservation compliance.
- Encouragement of tree planting.

- Enrollment in Hydrologic Unit Areas identified by the USDA Water Quality Initiative.
- Enrollment in established conservation priority areas.

Consistent with predetermined enrollment limits, nearly 2.5 million acres were enrolled in the 10th-12th signup periods. Owing to the redesigned bid acceptance process and new eligibility criteria, enrollment in these signup periods was quite different from that of signup periods 1-9. In general, enrollment shifted away from the Northern Plains, Southern Plains, and Mountain States and toward the Corn Belt, Delta, and Lake States. Enrollment percentages also increased in the Appalachian, Southeast, and Northeast regions.

## **Data Collection and Preparation**

Two data sets are developed by USDA's Consolidated Farm Service Agency (CFSA) following each CRP signup period. The first set contains information on all bids received during the signup period. Information contained in the first data set includes State and county Federal identification codes (FIPS), farm identification numbers, rental bids, acreage offered for enrollment, estimated current erosion rate, land capability class and subclass of land in the field(s) offered for enrollment, soil loss tolerance level, crop (fiscal) year in which retirement would begin, number of acres of trees to be planted, and the type of crop base, base acreage, and base yield to be retired for the 10-year CRP contract period. This information is preliminary since it was collected before inspection of the site.

Approximately 60 days after each signup, CFSA personnel develop a second data set for contracted acreage following onsite inspections. This contract data set contains verified information from above plus additional information including estimated erosion after CRP retirement; the cost, type, and extent of conservation practice treatment; and the farm size.

The statistics presented in this report are based on tabulations of the initial contract data sets for signup periods 1-12, and as such overestimate to some extent the amount of land currently enrolled in the CRP. Some contracts were prematurely terminated during 1986-94. In addition, USDA allowed CRP participants an "early-out" option during May 15-June 2, 1995, in which CRP acreage could be removed from the program without assessment of penalties. Producers used the "early-out" option to remove about 650,000 acres from the program. USDA held a 13th CRP signup to replace this acreage with more environmentally sensitive land in September 1995. Statistics from the "early-out" option and the 13th "replacement" signup were not available for this report.

Data representing individual CRP contracts were aggregated to the State, regional, and national levels. USDA's farm production regions (fig. 1) served as the focus for regional aggregation. Acreage variables were summed across individual contracts to the different aggregation levels. Variables, such as rental rate and erosion reduction, that are not additive were summarized as acre-weighted averages. This aggregation leads to some mathematical rounding errors. Information presented in the following tables should, consequently, be considered as approximate.

Figure 2 shows a map of CRP enrollment for signup periods 1-12. Figure 3 is a bar chart of CRP acreage as contracts are currently scheduled to expire.

## **Description of Tables**

Seventeen sets of tables were developed to display information contained in the CRP contract data sets. Tables 1-9I represent all CRP acreage enrolled in signup periods 1-12, while tables 10-17 present corresponding statistics only for land newly retired in fiscal years 1986-93, respectively. Tables 1 and 10-17 summarize general interest variables: number of contracts, acres enrolled, acres with tree plantings, average annual per acre rental payments, average erosion reductions, and the total number of acres of cropland base reduction. The average erosion reduction is the difference between before-CRP and after-CRP erosion rates as estimated by the Natural Resources Conservation Service.

Table 2 shows the number of contracts and acres enrolled under the wetland and scour erosion eligibility criteria

Figure 1  
 U.S. farm production regions

that were first introduced in the eighth CRP sign-up period. The table also shows contracts and acres enrolled in conservation priority areas, water quality areas, and wellhead protection areas. The last three designations relate to land made eligible beginning with the 10th sign-up period following passage of the 1990 Act. In the 10th-11th sign-up periods, conservation priority areas included all cropland in the Chesapeake Bay region, the Great Lakes region, and the Long Island Sound region. In the 12th sign-up, additional small watersheds nominated by the States were added to previous conservation priority areas. Water quality areas included cropland within Hydrologic Unit Areas identified under the USDA Water Quality Initiative. Wellhead protection areas related to cropland within EPA State-approved wellhead protection programs.

Table 3 describes number of contracts and enrolled acres by contract or bid type. In sign-up periods 1-9, the only contract type was the "Standard" 10-year contract. In the 10th and 11th sign-up periods, "Easement," "Wellhead Standard," and "Wellhead Easement" contracts were also offered. Easement contracts required farmers to maintain vegetative covers for the "useful-life" of the practice. For example, the useful life of grass filter strips is 15 years, while the useful life of tree filter strips is 30 years.

Table 4 gives the number of contracts and acres enrolled by soil loss tolerance level. The soil loss tolerance level (T) has been defined as the maximum rate of annual per acre soil erosion that will permit a high level of crop productivity to occur indefinitely. T is an indicator, on a scale of whole numbers from 1 to 5, of the soil's natural rate of regeneration in tons per acre per year. Soil with a tolerance level of 1 is more susceptible to erosion-induced productivity loss than soil with a tolerance level of 5. The 1982 National Resources Inventory indicates that 71.4 percent of the Nation's cropland has a T-value of 5. The remaining 11.4, 12.9, 3.6, and 0.6 percent of the Nation's cropland has T-values of 4, 3, 2, and 1, respectively.

Table 5 describes the number of acres enrolled at various levels of before-CRP erosion. Wind erosion is the major source of erosion in the Western United States, while sheet and rill erosion caused by the action of water dominates in the East.

Figure 2

## Conservation Reserve Program enrollment, signup periods 1-12

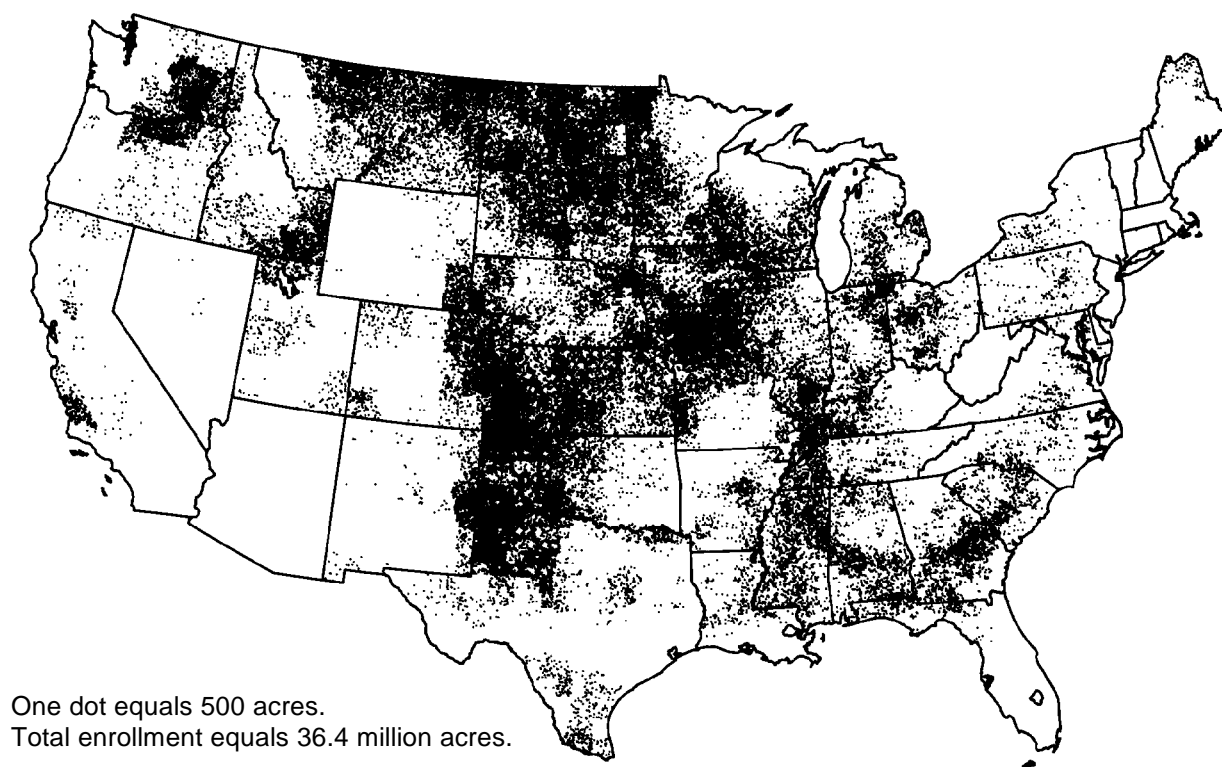

Table 6 shows number of contracts and acres enrolled by erodibility index level. The erodibility index, based on the physical factors of the Universal Soil Loss Equation and the soil loss tolerance level, characterizes the inherent tendency of a soil to erode. Higher numbers indicate a greater erosion tendency. The conservation compliance provision of the 1985 Act applies to fields in which one-third or more of the soil exhibits an erodibility index of 8 or more. Erodiability indices were not collected prior to the 10th signup period.

Table 7 provides a detailed breakdown of CRP acres enrolled by land capability class and subclass. LCC I-VIII denote the degree to which certain factors interfere with crop production. There are no limits to crop production on LCC I soils, while soils in LCC VIII have the greatest limitations for crop production. Factors that inhibit or limit continuous crop production are referred to as Subclass C (climate conditions), Subclass E (erosion), Subclass S (soil characteristics), and Subclass W (wet soils).

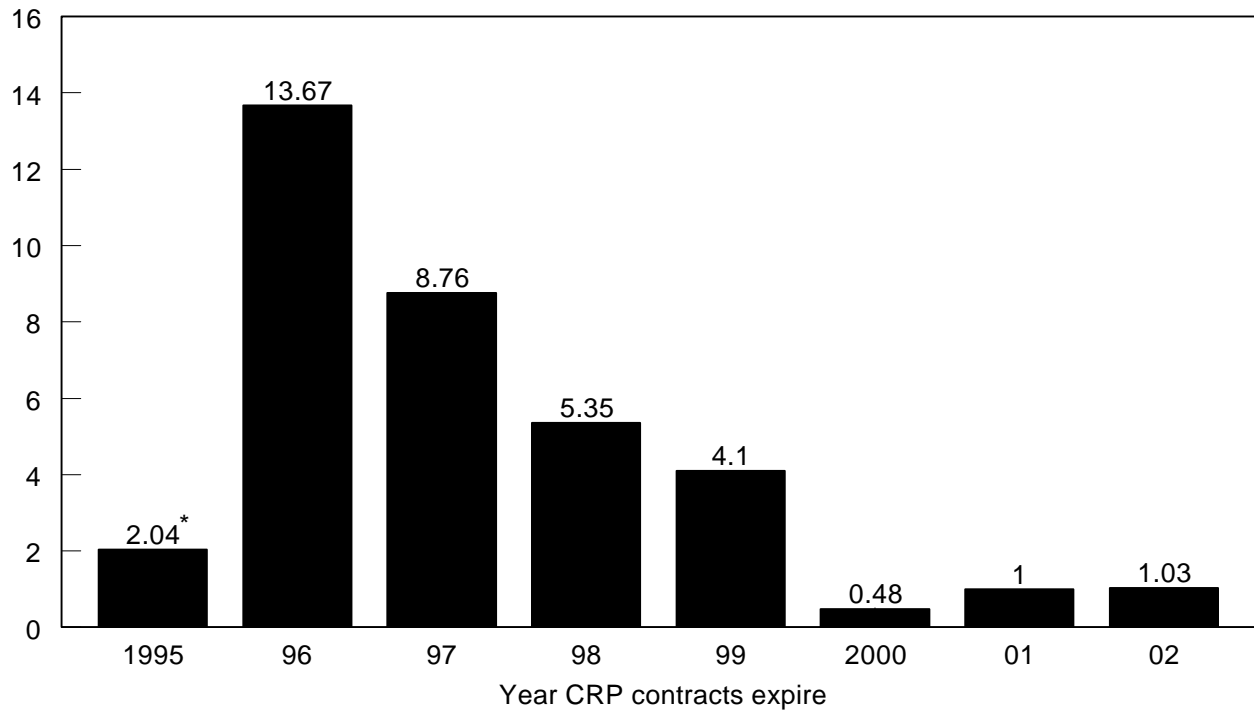

Tables 8A and 8B describe the base acreage retired by the CRP for 10 USDA program crops: barley, corn, extra-long staple cotton, upland cotton, oats, peanuts, rice, sorghum, tobacco, and wheat. The number of contracts and the average base yield are also provided for each of the crops. One should not assume that these yields and acres provide a measure of the reduction in commodity production provided by the CRP. The yields reported are program yields and may not reflect current actual crop yields. The acres may not have been planted to the program crop in previous years (that is, land could have been idle, fallow, set-aside, or planted to other crops).

Finally, tables 9A through 9I present number of contracts, acres treated, total cost share, and cost share per treated acre for the various conservation practices approved for CRP enrollment. The per acre cost share sometimes appears quite large for practices such as WP 1 (sediment retention/water control structures) and WP 3 (sod waterways). However, these practices are usually placed on only a few acres and more than one conservation practice may be applied to a specific acre in a field. The average cost share for treating an entire field seldom exceeds \$100 per acre. The information presented in these tables is based on the sum of acreage treated by each practice rather than the sum of acres enrolled. The sum of acres treated will usually exceed the number of acres enrolled.

Figure 3

### Schedule of CRP contract expiration

Million acres

\*Producers with acreage expiring in 1995 have the option to extend their contracts 1 year.

"-" - NO ENROLLMENT

1/ DATA SHOWN ARE BASED ON CONTRACTS REPORTING AT LEAST 0.1 ACRE OF TREE PLANTINGS.

2/ EROSION REDUCTION EQUALS EROSION RATE BEFORE IMPLEMENTATION OF CONSERVATION PRACTICE MINUS EROSION RATE AFTER IMPLEMENTATION.
